**Pre-Con®**

**Description:**
Pre-Con® is a liquid casing water conditioner for pipeline casings. It consists of "wetting" and filming agents, vapor phase inhibitors, alkaline media additives and antibacterial conditioners.

**End Use:**
Pre-Con is poured into the casing prior to the installation of Trenton Fill-Coat® Casing Filler. The method of using these two materials together is a Trenton Corporation patented process.*

Pre-Con conditions the water accumulated in the casing so that any small amounts of water that may be entrapped after installation of Fill-Coat Casing Filler are inhibited and no corrosion should occur.

**Application Procedures:**
Prior to the filling operation, Pre-Con is poured directly into the casing through the casing vent and mixes with any water accumulated inside the casing. The casing can then be filled with Trenton Fill-Coat Casing Filler.

**Packaging:**
Pre-Con is packaged in five-gallon pails or is provided in bulk at the job site when Trenton crews install Fill-Coat Casing Filler.

**Specifications:**
- Solubility in water: 100%
- Specific gravity: 1.13
- Color: Amber
- Flash point: None

**Advantages:**
Five gallons per 1,000 gallons of casing capacity.
